Infosys Financial Statement Analysis

DAX Measures and Formula Documentation (FY2023–FY2026)

Technical documentation for the 13 Power BI measures

Item	Details
Project	Infosys Financial Statement Analysis Dashboard, FY2023 to FY2026
Tools	Power BI, DAX; data prepared in Python (Google Colab)
Data table	'Sheet1' (columns used: Value_Cr, Statement, Line_Item_as_reported, Fiscal_Year)
Measures documented	13 (Revenue and Profitability: 6, Balance Sheet and Liquidity: 3, Cash Flow: 4)
Unit	₹ crore unless stated
Source of formulas	Recorded formulas supplied by the project owner. No Power BI formula-bar screenshots were supplied.
Prepared by	Janga Vignesh
Date	November 2026

Note on completeness. The formulas below are the project's recorded formulas and are reproduced exactly. Because no formula-bar screenshots were supplied, none of the 13 formulas could be compared with the live Power BI version, and each carries the status "Requires formula screenshot". Where the dashboard screenshots show something different from the recorded formulas or from the values supplied, the difference is stated in Section 6 and is not silently corrected.

1. Overview and Data Model

1.1 Purpose of this document

This document explains every DAX measure behind the Infosys dashboard: what it calculates, how each part of the formula works, what it should return for FY2023 to FY2026, and how to check the result against the source data.

1.2 Source table and columns

Column in 'Sheet1'	Role in the measures
Value_Cr	Numeric value in ₹ crore. Every measure sums this column.
Statement	Which statement a row belongs to. Values seen in the screenshots are "Income Statement" and "Cash Flow". The value "Balance Sheet" used by Measures 7 to 9 does not appear in the supplied screenshots.
Line_Item_as_reported	Name of the line item, for example "Revenue from operations". The measures match on this text exactly.
Fiscal_Year	Financial year (FY2023 to FY2026). Used by the slicer, the chart axes and Measure 5.

1.3 Measure map

No.	Measure	Category	Built from	Format
1	Total Revenue	A	Value_Cr	Currency/number
2	Total Net Profit	A	Value_Cr	Currency/number
3	Total PBT	A	Value_Cr	Currency/number
4	Net Profit Margin %	A	[Total Net Profit], [Total Revenue]	Percentage, 2 decimals
5	Revenue Growth %	A	[Total Revenue]	Percentage, 2 decimals
6	Effective Tax Rate %	A	Value_Cr, [Total PBT]	Percentage, 2 decimals
7	Total Equity	B	Value_Cr	Number
8	Current Ratio	B	Value_Cr	Decimal, 2 places
9	Working Capital	B	Value_Cr	Number (₹ crore)
10	Operating Cash Flow	C	Value_Cr	Number (₹ crore)
11	Investing Cash Flow	C	Value_Cr	Number (₹ crore)
12	Financing Cash Flow	C	Value_Cr	Number (₹ crore)
13	Free Cash Flow	C	[Operating Cash Flow], Value_Cr	Number (₹ crore)

Categories: A = Revenue and Profitability, B = Balance Sheet and Liquidity, C = Cash Flow. Measures 4, 5, 6 and 13 depend on other measures, so an error in Measures 1, 2, 3 or 10 passes into them.

The dashboard also shows Total_expenses and Basic and Diluted EPS (the Page 1 charts and Figure 2). These are not among the 13 measures supplied, so they are not documented here (see Section 6).

1.4 Validation status labels

Status	Meaning
Verified against source data	Matches a value visible in the source workbook or Power BI data table, or reproduces from source lines.
Matches dashboard output	Matches a value shown on the dashboard, including card totals and chart labels.
Approximate – dashboard label only	Only a rounded chart label is available, so the exact value is not confirmed.
Requires formula screenshot	The formula-bar version in Power BI has not been seen.
Requires source-level reconciliation	The result must be checked against the underlying source rows.
Needs correction	A supplied value or an on-screen result differs from the calculation.

2. DAX Measures

A. Revenue and Profitability Measures

Measure 1: Total Revenue

1. Business purpose. Revenue is the starting point of the analysis. Revenue growth, net profit margin and the revenue-versus-expense comparison all depend on it, so one measure defines it once for every visual.

2. Financial definition. Total Revenue is the income Infosys earned from its operations, in ₹ crore, for the selected year or years. It excludes "Other income, net", which is not earned from the core business.

3. Complete DAX formula. (Recorded formula, reproduced without change.)

```
Total Revenue =
CALCULATE(
    SUM('Sheet1'[Value_Cr]),
    'Sheet1'[Line_Item_as_reported] = "Revenue from operations"
)
```

4. Formula explanation, line by line.

Line or component	Explanation
Total Revenue =	Names the measure. Other measures refer to it as [Total Revenue].
CALCULATE(	Evaluates its first argument after applying the filters listed after it, on top of the filters already in the report (for example the Fiscal_Year slicer).
SUM('Sheet1'[Value_Cr])	Adds the Value_Cr values of the rows left after filtering.
'Sheet1'[Line_Item_as_reported] = "Revenue from operations"	Keeps only rows whose line item is exactly "Revenue from operations". The text must match the source label character for character.
)	Closes CALCULATE.

5. Calculation logic. The measure reduces Sheet1 to the rows labelled Revenue from operations and sums Value_Cr. There is one such row per year, so a single-year result equals that row and a multi-year result is the sum of the yearly rows. The formula has no Statement filter, unlike Measures 2 and 3, because the label appears only in the Income Statement in the data seen.

6. Example calculation.

Why revenue from operations and not total income: total income is revenue from operations plus other income, net. For FY2023 that is 146,767 + 2,701 = 149,468. Using total income would raise the revenue base by about 1.84% (2,701 ÷ 146,767) and would mix non-core income into growth and margin. For FY2023 it would lower the net profit margin from 16.43% to 16.13% (24,108 ÷ 149,468).

FY2023 slicer selected: Value_Cr of the row "Revenue from operations" = 146,767.

No year selected: 146,767 + 153,670 + 162,990 + 178,650 = 642,077.

7. Expected output. Amounts in ₹ crore.

Financial year	Output	Validation status
FY2023	146,767	Verified against source data. Matches dashboard output (146.8K)
FY2024	153,670	Matches dashboard output (153.7K)
FY2025	162,990	Matches dashboard output (163.0K)
FY2026	178,650	Matches dashboard output (178.7K)
All years	642,077	Matches dashboard output (Page 1 card ₹6,42,077)

8. Business interpretation. Rising revenue indicates growth in the core business. Revenue rose every year, and the yearly increase grew from 6,903 (FY2024) to 9,320 (FY2025) to 15,660 (FY2026). A fall would signal lower demand or pricing, and would also raise the cost ratio if expenses did not fall.

9. Dashboard usage. Page 1: Total Revenue card, Total Revenue line chart, and the Total_expenses vs Total Revenue column chart. Page 2: PBT, Revenue and Net Profit column chart. It is also the base for Measures 4 and 5.

10. Validation. Filter RAW_ALL_DATA to Line_Item_as_reported = Revenue from operations and compare each year with Value_Cr. The FY2023 source row is 146,767. The four-year total of 642,077 matches the Page 1 card. Also check that the label is not repeated in another statement.

Status. Formula: Requires formula screenshot. Output: FY2023 Verified against source data; all years Matches dashboard output.

Measure 2: Total Net Profit

1. Business purpose. Net profit is the bottom line of the Income Statement. It is needed for the profit trend, the margin and the comparison with PBT.

2. Financial definition. Total Net Profit is the profit Infosys kept for the year after all expenses and tax, in ₹ crore.

3. Complete DAX formula. (Recorded formula, reproduced without change.)

```
Total Net Profit =
CALCULATE(
    SUM('Sheet1'[Value_Cr]),
    'Sheet1'[Statement] = "Income Statement",
    'Sheet1'[Line_Item_as_reported] = "Profit for the year"
)
```

4. Formula explanation, line by line.

Line or component	Explanation
Total Net Profit =	Names the measure.
CALCULATE(	Applies the two filters below before summing.
SUM('Sheet1'[Value_Cr])	Adds the Value_Cr values of the remaining rows.
'Sheet1'[Statement] = "Income Statement"	Keeps only Income Statement rows.

Line or component	Explanation
'Sheet1'[Line_Item_as_reported] = "Profit for the year"	Keeps only the line named “Profit for the year”. Both filters must be true for a row to be included.
)	Closes CALCULATE.

5. Calculation logic. A row is summed only if it is in the Income Statement and is labelled Profit for the year. One row per year satisfies this, so the result for a year is that row’s value.

6. Example calculation.

Why the Statement filter is needed: the Power BI table view (Figure 4) shows that the Cash Flow statement also begins with a line called “Profit for the year” (24108 for FY2023). Without the Statement filter, FY2023 would return 24,108 + 24,108 = 48,216.

FY2023: Income Statement row “Profit for the year” = 24,108.

All years: 24,108 + 26,248 + 26,750 + 29,474 = 106,580.

7. Expected output. Amounts in ₹ crore.

Financial year	Output	Validation status
FY2023	24,108	Verified against source data. Matches dashboard output (24.1K)
FY2024	26,248	Matches dashboard output (26.2K)
FY2025	26,750	Matches dashboard output (26.8K)
FY2026	29,474	Matches dashboard output (29.5K)
All years	106,580	Matches dashboard output (Page 1 card ₹106.58K)

8. Business interpretation. Net profit grew from 24,108 to 29,474 (+22.26%). Year-on-year growth was +8.88% (FY2024), +1.91% (FY2025) and +10.18% (FY2026). The FY2025 slowdown is the unusual movement: revenue grew 6.06% that year but net profit grew only 1.91%.

9. Dashboard usage. Page 1: Total Net Profit card and line chart. Page 2: PBT, Revenue and Net Profit column chart. It is the numerator of Measure 4.

10. Validation. Compare with the Income Statement row Profit for the year in RAW_ALL_DATA (FY2023: 24,108). Cross-check: PBT − total tax = 33,322 − 9,214 = 24,108. The four-year total matches the Page 1 card.

Status. Formula: Requires formula screenshot. Output: FY2023 Verified against source data; all years Matches dashboard output.

Measure 3: Total PBT

1. Business purpose. Profit before tax shows operating performance without the effect of the tax charge. It is the base for the effective tax rate and helps explain differences between profit growth and net profit growth.

2. Financial definition. Profit Before Tax (PBT) is total income minus total expenses, before income tax is deducted.

3. Complete DAX formula. (Recorded formula, reproduced without change.)

```
Total PBT =
CALCULATE(
    SUM('Sheet1'[Value_Cr]),
    'Sheet1'[Statement] = "Income Statement",
    'Sheet1'[Line_Item_as_reported] = "Profit before tax"
)
```

4. Formula explanation, line by line.

Line or component	Explanation
Total PBT =	Names the measure.
CALCULATE(	Applies the two filters before summing.
SUM('Sheet1'[Value_Cr])	Adds Value_Cr for the remaining rows.
'Sheet1'[Statement] = "Income Statement"	Restricts the rows to the Income Statement.
'Sheet1'[Line_Item_as_reported] = "Profit before tax"	Selects the reported PBT line.
)	Closes CALCULATE.

5. Calculation logic. The measure does not calculate PBT itself. It reads the reported Profit before tax line. In the Income Statement this line comes before the Current tax and Deferred tax lines, so it is a before-tax figure.

6. Example calculation.

FY2023 reconciliation: total income 149,468 − total expenses 116,146 = 33,322, which equals the reported PBT.

All years: 33,322 + 35,988 + 37,608 + 39,995 = 146,913.

7. Expected output. Amounts in ₹ crore.

Financial year	Output	Validation status
FY2023	33,322	Verified against source data. Matches dashboard output (33K)
FY2024	35,988	Matches dashboard output (36K)
FY2025	37,608	Matches dashboard output (38K)
FY2026	39,995	Matches dashboard output (40K)
All years	146,913	Matches dashboard output (Page 1 card ₹1,46,913)

8. Business interpretation. PBT grew from 33,322 to 39,995 (+20.02%). Year-on-year: +8.00% (FY2024), +4.50% (FY2025), +6.35% (FY2026). Slower PBT growth in FY2025 was the first part of that year’s net profit slowdown.

9. Dashboard usage. Page 1: Total PBT card. Page 2: PBT, Revenue and Net Profit column chart. It is the denominator of Measure 6.

10. Validation. Compare with the Income Statement row Profit before tax in RAW_ALL_DATA (FY2023: 33,322). Recalculate as Total income − Total expenses. The four-year total matches the Page 1 card.

Status. Formula: Requires formula screenshot. Output: FY2023 Verified against source data; all years Matches dashboard output.

Measure 4: Net Profit Margin %

1. Business purpose. The margin shows how much of each rupee of revenue becomes net profit. It allows years to be compared even when revenue changes.

2. Financial definition. Net profit margin is net profit divided by revenue. A margin of 16.43% means ₹16.43 of net profit for every ₹100 of revenue.

3. Complete DAX formula. (Recorded formula, reproduced without change.)

```
Net Profit Margin % =
DIVIDE(
    [Total Net Profit],
    [Total Revenue],
    0
)
```

4. Formula explanation, line by line.

Line or component	Explanation
Net Profit Margin % =	Names the measure.
DIVIDE(	Divides the first argument by the second and handles a zero or blank denominator.
[Total Net Profit],	Numerator: Measure 2.
[Total Revenue],	Denominator: Measure 1.
0	Alternate result. If revenue is zero or blank the measure returns 0 and not an error.
)	Closes DIVIDE.

5. Calculation logic. Both inputs are evaluated in the current filter context, so for any year the margin uses that year's net profit and revenue. For several years selected together, it divides the total profit by the total revenue (not the average of yearly margins).

6. Example calculation.

FY2023: 24,108 ÷ 146,767 = 0.16426, shown as 16.43%.

FY2026: 29,474 ÷ 178,650 = 0.16498, shown as 16.50%.

All years: 106,580 ÷ 642,077 = 0.16599, shown as 16.60%.

Why DIVIDE: ordinary division by zero returns an error, while DIVIDE returns the alternate result. Why no × 100: the Percentage format multiplies by 100 for display. A formula that also multiplied by 100 would show 1,643.00% for FY2023.

7. Expected output. The dashboard shows these values without a percent sign (see Section 6, D1).

Financial year	Output	Validation status
FY2023	0.16426, shown as 16.43%	Verified against source data (source lines). Matches dashboard output (16.43)
FY2024	0.17081, shown as 17.08%	Matches dashboard output (17.08)
FY2025	0.16412, shown as 16.41%	Matches dashboard output (16.41)
FY2026	0.16498, shown as 16.50%	Matches dashboard output (16.50). The value 16.49% supplied earlier: Needs correction
All years	0.16599, shown as 16.60%	Matches dashboard output (Page 1 card 16.60)

8. Business interpretation. The margin stayed between 16.41% and 17.08%. FY2024 was the peak and FY2025 the low. FY2026 (16.50%) is almost the same as FY2023 (16.43%), so profit growth came from revenue growth and not from wider margins.

9. Dashboard usage. Page 1: Net Profit Margin % card. Page 2: Net Profit Margin % line chart.

10. Validation. Recalculate from the confirmed values in Section 4. Check that the Format setting of the measure is Percentage with two decimals. The on-screen values (for example 16.60 on the card) have no percent sign, so the formula-bar version and the format need to be checked (D1).

Status. Formula: Requires formula screenshot. Output: Matches dashboard output, with FY2026 Needs correction in the supplied table (16.49% should read 16.50%).

Measure 5: Revenue Growth %

1. Business purpose. Growth shows whether the business is expanding and whether the pace is rising or falling. It needs the previous year's revenue, which the formula finds from the selected year.

2. Financial definition. Revenue growth is the change in revenue from the previous year, as a share of the previous year's revenue.

3. Complete DAX formula. (Recorded formula, reproduced without change.)

```
Revenue Growth % =
VAR CurrentRevenue = [Total Revenue]

VAR PreviousRevenue =
   CALCULATE(
      [Total Revenue],
      FILTER(
         ALL('Sheet1'[Fiscal_Year]),
         'Sheet1'[Fiscal_Year] =
            "FY" &
            FORMAT(
               VALUE(RIGHT(SELECTEDVALUE('Sheet1'[Fiscal_Year]), 4)) - 1,
               "0000"
            )
      )
   )

RETURN
   DIVIDE(
      CurrentRevenue - PreviousRevenue,
      PreviousRevenue
```

```
)
```

4. Formula explanation, line by line.

Line or component	Explanation
Revenue Growth % =	Names the measure.
VAR CurrentRevenue = [Total Revenue]	VAR stores a value in a named variable. CurrentRevenue holds revenue for the year in the current filter context.
VAR PreviousRevenue =	A second variable that will hold the previous year's revenue.
CALCULATE(	Evaluates [Total Revenue] in a changed filter context: the previous year.
[Total Revenue],	The expression to evaluate.
FILTER(	Returns only the rows of a table that meet a condition.
ALL('Sheet1'[Fiscal_Year]),	Returns every financial year and ignores the slicer, so years other than the selected one can be reached.
'Sheet1'[Fiscal_Year] =	The condition: keep the year that equals the text built below.
SELECTEDVALUE('Sheet1'[Fiscal_Year])	Returns the single selected year, for example "FY2025". Returns blank if no year or several years are selected.
RIGHT(..., 4)	Takes the last four characters, "2025".
VALUE(...)	Converts the text "2025" to the number 2025.
... - 1	Subtracts one year, giving 2024.
FORMAT(..., "0000")	Converts 2024 back to text with four digits, "2024".
"FY" & ...	Joins "FY" and "2024" into "FY2024", the label used in the data.
RETURN	Marks the end of the variables and the start of the result.
DIVIDE(CurrentRevenue - PreviousRevenue, PreviousRevenue)	Change in revenue divided by previous revenue. No alternate result is given, so the answer is blank when the denominator is blank or zero.

5. Calculation logic. For the selected year the formula builds the label of the year before, asks Total Revenue for that year, and compares. Because ALL removes the slicer filter on Fiscal_Year, the previous year can be found even when only the current year is selected. Total Revenue is still filtered to Revenue from operations inside this calculation.

6. Example calculation.

FY2025 step by step: SELECTEDVALUE = "FY2025"; RIGHT gives "2025"; VALUE gives 2025; minus 1 gives 2024; FORMAT gives "2024"; the label is "FY2024"; PreviousRevenue = 153,670; CurrentRevenue = 162,990.

Growth = (162,990 − 153,670) ÷ 153,670 = 9,320 ÷ 153,670 = 0.060649, shown as 6.06%.

FY2024: 6,903 ÷ 146,767 = 0.047033, shown as 4.70%. FY2026: 15,660 ÷ 162,990 = 0.096080, shown as 9.61%.

FY2023: the formula looks for FY2022, which is not in the dataset. FILTER returns no row, PreviousRevenue is blank, and DIVIDE returns blank. FY2023 therefore has no growth value.

7. Expected output.

Financial year	Output	Validation status
FY2023	Blank	Matches dashboard output (no FY2023 bar)
FY2024	4.70% (0.0470)	Matches dashboard output (4.70%). The value 4.71% supplied earlier: Needs correction
FY2025	6.06% (0.0606)	Matches dashboard output (6.06%). The value 6.07% supplied earlier: Needs correction
FY2026	9.61% (0.0961)	Matches dashboard output (9.61%)

8. Business interpretation. Growth accelerated each year, from 4.70% to 6.06% to 9.61%. A value below the previous year would mean slowing growth, and a negative value would mean revenue fell.

9. Dashboard usage. Page 2: Revenue Growth % column chart (FY2024 to FY2026).

10. Validation. Recalculate from the revenue values in Section 4. The chart on Page 2 shows 4.70%, 6.06% and 9.61%, which agree with the calculation. How the measure behaves when two or more years are selected has not been tested (see D11).

Status. Formula: Requires formula screenshot. Output: FY2024 and FY2025 supplied values Needs correction; the dashboard and the calculation agree.

Measure 6: Effective Tax Rate %

1. Business purpose. The effective tax rate shows how much of pre-tax profit was paid as tax. It explains why net profit can grow faster or slower than PBT.

2. Financial definition. Effective tax rate is total tax expense (current tax plus deferred tax) divided by profit before tax.

3. Complete DAX formula. (Recorded formula, reproduced without change.)

```
Effective Tax Rate % =
VAR TaxExpense =
    CALCULATE(
        SUM('Sheet1'[Value_Cr]),
        'Sheet1'[Statement] = "Income Statement",
        'Sheet1'[Line_Item_as_reported] IN {
            "Current tax",
            "Deferred tax"
        }
    )

RETURN
    DIVIDE(
        TaxExpense,
        [Total PBT],
        0
    )
```

4. Formula explanation, line by line.

Line or component	Explanation
Effective Tax Rate % =	Names the measure.
VAR TaxExpense =	Stores the total tax expense in a variable.
CALCULATE(SUM('Sheet1'[Value_Cr]), ...)	Sums Value_Cr after applying the two filters below.
'Sheet1'[Statement] = "Income Statement"	Restricts the rows to the Income Statement.
'Sheet1'[Line_Item_as_reported] IN { "Current tax", "Deferred tax" }	IN keeps rows whose line item is either of the two listed values. It works like two equality tests joined by OR.
RETURN	Starts the result expression.
DIVIDE(TaxExpense, [Total PBT], 0)	Tax expense divided by PBT (Measure 3). Returns 0 if PBT is zero or blank.

5. Calculation logic. Current tax is the tax for the year and deferred tax is the timing adjustment. Their sum is the total tax charged in the Income Statement. Deferred tax can be positive (extra charge) or negative (a credit that reduces the charge): in FY2023 it is (73). The sum is divided by PBT.

6. Example calculation.

FY2023: current tax 9,287 + deferred tax (73) = 9,214. 9,214 ÷ 33,322 = 0.2765, shown as 27.65%.

FY2024: total tax 9,740 (derived as PBT − net profit = 35,988 − 26,248). 9,740 ÷ 35,988 = 0.2706, shown as 27.06%.

FY2025: 10,858 (37,608 − 26,750) ÷ 37,608 = 0.2887, shown as 28.87%.

FY2026: 10,521 (39,995 − 29,474) ÷ 39,995 = 0.2631, shown as 26.31%.

7. Expected output. FY2024 to FY2026 tax amounts are derived from PBT − net profit, because the individual tax rows were supplied only for FY2023.

Financial year	Output	Validation status
FY2023	27.65%	Verified against source data (current and deferred tax rows). Matches dashboard output
FY2024	27.06%	Matches dashboard output (27.06%). The value 27.07% supplied earlier: Needs correction
FY2025	28.87%	Matches dashboard output (28.87%)
FY2026	26.31%	Matches dashboard output (26.31%)

8. Business interpretation. The rate rose to 28.87% in FY2025 and fell to 26.31% in FY2026. In FY2025 net profit grew 1.91% against PBT growth of 4.50%, which is consistent with the higher rate. In FY2026 net profit grew 10.18% against PBT growth of 6.35%, consistent with the lower rate. The reasons for the rate changes are not in the dataset.

9. Dashboard usage. Page 2: Effective Tax Rate % line chart.

10. Validation. FY2023: check the Current tax (9,287) and Deferred tax ((73)) rows in RAW_ALL_DATA. For other years, check the same two rows and confirm that their sum equals PBT − net profit. The Page 2 chart labels match.

Status. Formula: Requires formula screenshot. Output: FY2024 supplied value Needs correction (27.07% should read 27.06%); other years Matches dashboard output.

B. Balance Sheet and Liquidity Measures

Measure 7: Total Equity

1. Business purpose. Equity shows the part of the company's assets that belongs to shareholders. It supports the assessment of financial position alongside liquidity and cash flow.

2. Financial definition. Shareholders' equity is what remains of total assets after all liabilities are deducted. It includes share capital and accumulated reserves.

3. Complete DAX formula. (Recorded formula, reproduced without change.)

```
Total Equity =
CALCULATE(
    SUM('Sheet1'[Value_Cr]),
    'Sheet1'[Statement] = "Balance Sheet",
    'Sheet1'[Line_Item_as_reported] = "Total equity"
)
```

4. Formula explanation, line by line.

Line or component	Explanation
Total Equity =	Names the measure.
CALCULATE(	Applies the two filters before summing.
SUM('Sheet1'[Value_Cr])	Adds the Value_Cr values left after filtering.
'Sheet1'[Statement] = "Balance Sheet"	Restricts the rows to the Balance Sheet.
'Sheet1'[Line_Item_as_reported] = "Total equity"	Selects the line named exactly "Total equity". It does not match "Total equity and liabilities", which is a different line.
)	Closes CALCULATE.

5. Calculation logic. The measure reads the reported Total equity line from the Balance Sheet. A balance sheet balances as Total assets = Total equity + Total liabilities, so equity is a separate part of the "Total equity and liabilities" total that appears on Page 3.

6. Example calculation.

> No Total equity values were supplied in the project material, so no calculation can be shown. The identity can be checked once values are available: Total equity + Total liabilities = Total equity and liabilities (126K, 138K, 149K, 156K approximately on Page 3).

7. Expected output. No exact figures are given because none are supported by the source data or screenshots.

Financial year	Output	Validation status
FY2023	Not supplied	Requires source-level reconciliation
FY2024	Not supplied	Requires source-level reconciliation
FY2025	Not supplied	Requires source-level reconciliation

Financial year	Output	Validation status
FY2026	Not supplied	Requires source-level reconciliation

8. Business interpretation. Equity differs from liabilities: liabilities are amounts owed to others, while equity belongs to shareholders. Rising equity usually means profits are being retained, and a large fall could mean large payouts or losses. This cannot be assessed without the values.

9. Dashboard usage. Listed for Page 3 in the project plan. The supplied Page 3 screenshot (Figure 3) does not show a Total Equity visual or value.

10. Validation. Check the Balance Sheet rows for Total equity in RAW_ALL_DATA. Confirm that the Statement value “Balance Sheet” and the label “Total equity” are spelled exactly as in the data.

Status. Formula: Requires formula screenshot. Output: Requires source-level reconciliation.

Measure 8: Current Ratio

1. Business purpose. The current ratio shows whether short-term assets cover short-term obligations. It is the main liquidity measure on the dashboard.

2. Financial definition. Current ratio is total current assets divided by total current liabilities. Current assets are cash and items expected to turn into cash within a year. Current liabilities are amounts due within a year.

3. Complete DAX formula. (Recorded formula, reproduced without change.)

```
Current Ratio =
VAR CurrentAssets =
    CALCULATE(
        SUM('Sheet1'[Value_Cr]),
        'Sheet1'[Statement] = "Balance Sheet",
        'Sheet1'[Line_Item_as_reported] = "Total current assets"
    )

VAR CurrentLiabilities =
    CALCULATE(
        SUM('Sheet1'[Value_Cr]),
        'Sheet1'[Statement] = "Balance Sheet",
        'Sheet1'[Line_Item_as_reported] = "Total current liabilities"
    )

RETURN
    DIVIDE(
        CurrentAssets,
        CurrentLiabilities,
        0
    )
```

4. Formula explanation, line by line.

Line or component	Explanation
Current Ratio =	Names the measure.

Line or component	Explanation
VAR CurrentAssets = CALCULATE(...)	Stores the Total current assets value in a variable.
'Sheet1'[Statement] = "Balance Sheet"	Restricts the rows to the Balance Sheet (used in both variables).
'Sheet1'[Line_Item_as_reported] = "Total current assets"	Selects the reported total current assets line.
VAR CurrentLiabilities = CALCULATE(...)	Stores the Total current liabilities value in a second variable, with the same Balance Sheet filter.
'Sheet1'[Line_Item_as_reported] = "Total current liabilities"	Selects the reported total current liabilities line.
RETURN	Starts the result expression.
DIVIDE(CurrentAssets, CurrentLiabilities, 0)	Assets divided by liabilities. If liabilities are zero or blank the result is 0 and not an error.

5. Calculation logic. Each variable holds one year's value because the year's filter is already in context. The ratio is the two values divided. The result is a plain number and not a percentage.

6. Example calculation.

The source amounts were not supplied. Working back from the dashboard values (ratio and working capital, Measure 9) gives implied amounts: current liabilities = working capital ÷ (ratio − 1), and current assets = ratio × current liabilities.

FY2023: 31,700 ÷ 0.81 ≈ 39,100 liabilities; × 1.81 ≈ 70,800 assets. FY2024: ≈ 38,600 and ≈ 89,200. FY2025: ≈ 42,700 and ≈ 96,900. FY2026: ≈ 52,200 and ≈ 103,400.

These implied amounts are approximate, because they come from rounded labels. They are below total assets (126K to 156K) in every year, which is plausible.

7. Expected output. Ratios are unitless. Source-level confirmation of the current asset and liability values is still needed.

Financial year	Output	Validation status
FY2023	1.81	Matches dashboard output (dashboard label)
FY2024	2.31	Matches dashboard output (dashboard label)
FY2025	2.27	Matches dashboard output (dashboard label)
FY2026	1.98	Matches dashboard output (dashboard label)

8. Business interpretation. Above 1 means current assets exceed current liabilities. Below 1 would mean short-term obligations exceed short-term assets. The ratio peaked at 2.31 in FY2024 and fell to 1.98 in FY2026. The implied amounts suggest the FY2026 fall came mainly from higher current liabilities (about 42,700 to 52,200) while current assets rose (about 96,900 to 103,400). This should be confirmed from the source rows.

9. Dashboard usage. Page 3: Current Ratio line chart.

10. Validation. Check the Total current assets and Total current liabilities rows for each year in RAW_ALL_DATA and divide. Check that the two labels are spelled exactly as in the data and that Statement "Balance Sheet" exists.

Status. Formula: Requires formula screenshot. Output: Matches dashboard output; Requires source-level reconciliation.

Measure 9: Working Capital

1. Business purpose. Working capital shows, in rupees, how much short-term assets exceed short-term obligations. It complements the ratio by showing the size of the cushion.

2. Financial definition. Working capital is total current assets minus total current liabilities.

3. Complete DAX formula. (Recorded formula, reproduced without change.)

```
Working Capital =
VAR CurrentAssets =
    CALCULATE(
        SUM('Sheet1'[Value_Cr]),
        'Sheet1'[Statement] = "Balance Sheet",
        'Sheet1'[Line_Item_as_reported] = "Total current assets"
    )

VAR CurrentLiabilities =
    CALCULATE(
        SUM('Sheet1'[Value_Cr]),
        'Sheet1'[Statement] = "Balance Sheet",
        'Sheet1'[Line_Item_as_reported] = "Total current liabilities"
    )

RETURN
    CurrentAssets - CurrentLiabilities
```

4. Formula explanation, line by line.

Line or component	Explanation
Working Capital =	Names the measure.
VAR CurrentAssets = CALCULATE(...)	Stores Total current assets, using the Balance Sheet filter and the exact line label.
VAR CurrentLiabilities = CALCULATE(...)	Stores Total current liabilities in the same way.
RETURN CurrentAssets - CurrentLiabilities	Subtracts liabilities from assets. No DIVIDE is needed because there is no division.

5. Calculation logic. The two variables are the same as in Measure 8. The measure returns their difference, which is in the same unit as Value_Cr (₹ crore), so no scaling is applied.

6. Example calculation.

FY2023: current assets (≈ 70,800) − current liabilities (≈ 39,100) ≈ 31,700, which equals the dashboard value by construction (see the note in Measure 8).

FY2026: ≈ 103,400 − ≈ 52,200 ≈ 51,200.

7. Expected output. ₹ crore.

Financial year	Output	Validation status
FY2023	≈ 31,700	Approximate – dashboard label only (₹31.7K)
FY2024	≈ 50,600	Approximate – dashboard label only (₹50.6K)
FY2025	≈ 54,200	Approximate – dashboard label only (₹54.2K)
FY2026	≈ 51,200	Approximate – dashboard label only (₹51.2K)

8. Business interpretation. Positive working capital means short-term assets exceed short-term obligations, which indicates short-term capacity. Negative working capital would mean the opposite. Working capital rose 59.6% in FY2024, 7.1% in FY2025 and fell 5.5% in FY2026.

9. Dashboard usage. Page 3: Working Capital line chart.

10. Validation. Subtract the Total current liabilities row from the Total current assets row for each year in RAW_ALL_DATA. Only rounded labels (to ₹0.1K crore) are available now.

Status. Formula: Requires formula screenshot. Output: Approximate – dashboard label only; Requires source-level reconciliation.

C. Cash Flow Measures

Measure 10: Operating Cash Flow

1. Business purpose. Operating cash flow shows the cash produced by the regular business, which profit alone does not show.

2. Financial definition. Operating cash flow is the net cash generated by operating activities, after income taxes paid.

3. Complete DAX formula. (Recorded formula, reproduced without change.)

```
Operating Cash Flow =
CALCULATE(
    SUM('Sheet1'[Value_Cr]),
    'Sheet1'[Statement] = "Cash Flow",
    'Sheet1'[Line_Item_as_reported] =
        "Net cash generated by operating activities"
)
```

4. Formula explanation, line by line.

Line or component	Explanation
Operating Cash Flow =	Names the measure.
CALCULATE(	Applies the two filters before summing.
SUM('Sheet1'[Value_Cr])	Adds Value_Cr of the remaining rows.
'Sheet1'[Statement] = "Cash Flow"	Restricts the rows to the Cash Flow statement (the data uses the value “Cash Flow”).
'Sheet1'[Line_Item_as_reported] = "Net cash generated by operating activities"	Selects the reported total line. The text must match the source exactly. If the report words the line differently in a year, that year returns blank.
)	Closes CALCULATE.

5. Calculation logic. The measure reads the reported total. It does not add the separate operating lines.

6. Example calculation.

FY2023: cash generated from operations 31,261 − income taxes paid 8,794 = 22,467, which is the reported Net cash generated by operating activities (Figure 4).

7. Expected output. ₹ crore.

Financial year	Output	Validation status
FY2023	22,467	Verified against source data. Matches dashboard output (22K)
FY2024	≈ 25,000	Approximate – dashboard label only
FY2025	≈ 36,000	Approximate – dashboard label only
FY2026	≈ 34,000	Approximate – dashboard label only

8. Business interpretation. Operating cash flow rose from 22,467 to about 36,000 in FY2025 (about +60%), then eased to about 34,000 in FY2026. A fall while profit rises can signal cash tied up in receivables or other working capital, though this has not been analysed here.

9. Dashboard usage. Page 3: Operating Cash Flow column chart (the bars are ordered FY2025, FY2026, FY2024, FY2023 on the screenshot). It is the base of Measure 13.

10. Validation. Compare with the Net cash generated by operating activities row for each year in RAW_ALL_DATA. FY2023 matches.

Status. Formula: Requires formula screenshot. Output: FY2023 Verified against source data; FY2024 to FY2026 Approximate – dashboard label only.

Measure 11: Investing Cash Flow

1. Business purpose. Investing cash flow shows cash spent on or received from long-term assets and investments.

2. Financial definition. Investing cash flow is the net cash used in (or generated by) investing activities such as buying equipment and buying or selling investments.

3. Complete DAX formula. (Recorded formula, reproduced without change.)

```
Investing Cash Flow =
CALCULATE(
    SUM('Sheet1'[Value_Cr]),
    'Sheet1'[Statement] = "Cash Flow",
    'Sheet1'[Line_Item_as_reported] =
        "Net cash used in investing activities"
)
```

4. Formula explanation, line by line.

Line or component	Explanation
Investing Cash Flow =	Names the measure.

Line or component	Explanation
CALCULATE(	Applies the two filters before summing.
SUM('Sheet1'[Value_Cr])	Adds Value_Cr of the remaining rows.
'Sheet1'[Statement] = "Cash Flow"	Restricts the rows to the Cash Flow statement.
'Sheet1'[Line_Item_as_reported] = "Net cash used in investing activities"	Selects the line with this exact wording. If a year's report uses different wording (for example for a net inflow), that year returns blank.
)	Closes CALCULATE.

5. Calculation logic. The measure reads the reported total. A negative value means cash went out for investments and asset purchases, and a positive value means cash came in.

6. Example calculation.

FY2023: the dashboard shows about −1K (₹1,000 crore outflow). The source value was not supplied, so no exact calculation is shown.

Investing cash flow is not a simple capital expenditure figure. The FY2023 cash flow rows include large purchases and redemptions of investments (Figure 4), which largely offset each other.

7. Expected output. ₹ crore. The Page 3 chart shows an investing bar only for FY2023.

Financial year	Output	Validation status
FY2023	≈ −1,000	Approximate – dashboard label only
FY2024	No value visible	Requires source-level reconciliation
FY2025	No value visible	Requires source-level reconciliation
FY2026	No value visible	Requires source-level reconciliation

8. Business interpretation. A negative amount is normal for a growing company, because spending on assets and investments is an outflow. It is not automatically a problem. Missing bars for FY2024 to FY2026 are more likely a data or label issue than a real zero (see D6).

9. Dashboard usage. Page 3: Investing Cash Flow and Financing Cash Flow column chart.

10. Validation. List the Line_Item_as_reported values containing "investing" for each year in RAW_ALL_DATA and compare them with the text in the formula. Add any year-specific wording to the filter after confirming it.

Status. Formula: Requires formula screenshot. Output: Requires source-level reconciliation; FY2023 Approximate – dashboard label only.

Measure 12: Financing Cash Flow

1. Business purpose. Financing cash flow shows cash exchanged with lenders and shareholders, such as dividends and buybacks.

2. Financial definition. Financing cash flow is the net cash used in (or generated by) financing activities.

3. Complete DAX formula. (Recorded formula, reproduced without change.)

```
Financing Cash Flow =
CALCULATE(
    SUM('Sheet1'[Value_Cr]),
    'Sheet1'[Statement] = "Cash Flow",
    'Sheet1'[Line_Item_as_reported] =
        "Net cash used in financing activities"
)
```

4. Formula explanation, line by line.

Line or component	Explanation
Financing Cash Flow =	Names the measure.
CALCULATE(	Applies the two filters before summing.
SUM('Sheet1'[Value_Cr])	Adds Value_Cr of the remaining rows.
'Sheet1'[Statement] = "Cash Flow"	Restricts the rows to the Cash Flow statement.
'Sheet1'[Line_Item_as_reported] = "Net cash used in financing activities"	Selects the line with this exact wording.
)	Closes CALCULATE.

5. Calculation logic. The measure reads the reported total. Cash received from borrowing or issuing shares is positive. Cash paid for repaying borrowings, dividends and share buybacks is negative. The sign is kept as reported.

6. Example calculation.

The source value was not supplied. The dashboard labels show about −27K (FY2023), −18K (FY2024), −24K (FY2025) and −40K (FY2026).

7. Expected output. ₹ crore. Negative values are outflows.

Financial year	Output	Validation status
FY2023	≈ −27,000	Approximate – dashboard label only
FY2024	≈ −18,000	Approximate – dashboard label only
FY2025	≈ −24,000	Approximate – dashboard label only
FY2026	≈ −40,000	Approximate – dashboard label only

8. Business interpretation. A negative value is an outflow. Whether that is good or bad depends on the components: paying dividends or buying back shares returns cash to shareholders, while repaying debt reduces obligations. The detailed financing lines must be read before judging the FY2026 outflow, which is the largest of the four years (about 13K larger than FY2023).

9. Dashboard usage. Page 3: Investing Cash Flow and Financing Cash Flow column chart.

10. Validation. Compare with the Net cash used in financing activities row in RAW_ALL_DATA for each year, then review the individual financing lines beneath it.

Status. Formula: Requires formula screenshot. Output: Approximate – dashboard label only; Requires source-level reconciliation.

Measure 13: Free Cash Flow

1. Business purpose. Free cash flow shows the cash left after the business has paid for the equipment and intangible assets it needs. It indicates financial flexibility.

2. Financial definition. Free cash flow is operating cash flow minus capital expenditure (CapEx). CapEx is spending on property, plant and equipment and intangible assets.

3. Complete DAX formula. (Recorded formula, reproduced without change.)

```
Free Cash Flow =
VAR CapEx =
   CALCULATE(
      SUM('Sheet1'[Value_Cr]),
      'Sheet1'[Statement] = "Cash Flow",
      'Sheet1'[Line_Item_as_reported] =
         "Expenditure on property, plant and equipment and intangibles"
   )

RETURN
   [Operating Cash Flow] + CapEx
```

4. Formula explanation, line by line.

Line or component	Explanation
Free Cash Flow =	Names the measure.
VAR CapEx = CALCULATE(...)	Stores the CapEx value in a variable.
'Sheet1'[Statement] = "Cash Flow"	Restricts the rows to the Cash Flow statement.
'Sheet1'[Line_Item_as_reported] = "Expenditure on property, plant and equipment and intangibles"	Selects the CapEx line by its exact reported name. It is stored as a negative number (for example −2,579 in FY2023) because it is a cash outflow.
RETURN [Operating Cash Flow] + CapEx	Adds CapEx to operating cash flow (Measure 10). Because CapEx is negative, adding it deducts the spending.

5. Calculation logic. FCF = Operating cash flow + CapEx, where CapEx is negative. Subtracting a positive CapEx and adding a negative CapEx give the same result. The formula adds because the stored sign is already negative. If the CapEx line is not found, CapEx is blank and the measure returns operating cash flow unchanged, without an error.

6. Example calculation.

FY2023: 22,467 + (−2,579) = 19,888, shown as 19.9K.

Implied CapEx from the dashboard labels (operating cash flow − free cash flow): about 2,000 (FY2024), about 2,500 (FY2025) and about 0 (FY2026).

The FY2026 figures are the concern: operating cash flow (about 34,000) and free cash flow (34,000) are almost equal. With this formula that happens if the FY2026 CapEx line is missing or worded differently, so CapEx returns blank.

7. Expected output. ₹ crore.

Financial year	Output	Validation status
FY2023	19,888 (shown 19.9K)	Verified against source data. Matches dashboard output
FY2024	≈ 23,000	Approximate – dashboard label only
FY2025	≈ 33,500	Approximate – dashboard label only
FY2026	≈ 34,000	Needs correction / Requires source-level reconciliation (equals operating cash flow)

8. Business interpretation. Free cash flow rose from 19,888 to about 34,000 (+70.9% on the labels). Most of the rise was in FY2025 (+45.7%). A rise in FY2026 while operating cash flow fell is unusual and is explained only if CapEx was close to zero, which is not expected for a company of this size. The FY2026 free cash flow may therefore be overstated.

9. Dashboard usage. Page 3: Free Cash Flow line chart.

10. Validation. FY2023 matches the source: 22,467 − 2,579 = 19,888. For FY2026, filter RAW_ALL_DATA to Cash Flow and Investing activities and check how the CapEx line is worded. A COUNTROWS check is suggested in Section 6.2.

Status. Formula: Requires formula screenshot. Output: FY2023 Verified against source data; FY2024 and FY2025 Approximate – dashboard label only; FY2026 Needs correction.

3. DAX Technical Concepts

Only the functions and operators that appear in the 13 formulas are covered.

CALCULATE()

Item	Description
What it does	Evaluates an expression after changing the filter context. Filters given as arguments are added to, or replace, the filters already in the report.
Basic syntax	CALCULATE(<expression>, <filter1>, <filter2>, ...)
Where used in this project	Measures 1 to 3 and 5 to 13.
Example	Total Net Profit with the FY2024 slicer selected: CALCULATE keeps the FY2024 filter and adds Statement = Income Statement and Line_Item = Profit for the year, so SUM returns 26,248.

SUM()

Item	Description
What it does	Adds the values in a numeric column for the rows that are visible in the current filter context.
Basic syntax	SUM(<column>)
Where used in this project	Every base measure: SUM('Sheet1'[Value_Cr]).
Example	With filters leaving only the Revenue from operations row for FY2023, SUM returns 146,767.

DIVIDE()

Item	Description
What it does	Divides one value by another. If the denominator is zero or blank it returns an alternate result (blank if none is given) and not an error.
Basic syntax	DIVIDE(<numerator>, <denominator> [, <alternateresult>])
Where used in this project	Measures 4, 5, 6 and 8.
Example	Net Profit Margin %: DIVIDE(24,108, 146,767, 0) returns 0.16426 for FY2023. In Revenue Growth % there is no alternate result, so FY2023 returns blank.

VAR

Item	Description
What it does	Stores the result of an expression in a named variable so it can be reused. The value is calculated once, in the filter context where VAR is written.
Basic syntax	VAR <name> = <expression>
Where used in this project	Measures 5, 6, 8, 9 and 13.
Example	In Free Cash Flow, VAR CapEx stores the CapEx amount (−2,579 for FY2023).

RETURN

Item	Description
What it does	Marks the end of the VAR declarations and gives the expression whose value the measure returns.
Basic syntax	VAR ... RETURN <expression>
Where used in this project	Measures 5, 6, 8, 9 and 13.
Example	In Working Capital, RETURN CurrentAssets - CurrentLiabilities gives the final value.

FILTER()

Item	Description
What it does	Returns the rows of a table for which a condition is true.
Basic syntax	FILTER(<table>, <condition>)
Where used in this project	Measure 5, to select the previous year.
Example	FILTER(ALL('Sheet1'[Fiscal_Year]), 'Sheet1'[Fiscal_Year] = "FY2024") returns a one-row table containing FY2024.

ALL()

Item	Description
What it does	Returns a table or column with all its values and removes existing filters on it.
Basic syntax	ALL(<table or column>)
Where used in this project	Measure 5: ALL('Sheet1'[Fiscal_Year]).
Example	If only FY2025 is selected, ALL still lets the formula reach FY2024. Without it the FY2025 filter would hide FY2024.

SELECTEDVALUE()

Item	Description
What it does	Returns the value of a column when exactly one value is in the filter context, otherwise a blank or an alternate value.
Basic syntax	SELECTEDVALUE(<column> [, <alternateresult>])
Where used in this project	Measure 5.
Example	With the FY2025 slicer selected, SELECTEDVALUE('Sheet1'[Fiscal_Year]) returns “FY2025”.

RIGHT()

Item	Description
What it does	Returns the last characters of a text value.
Basic syntax	RIGHT(<text>, <number of characters>)
Where used in this project	Measure 5.
Example	RIGHT("FY2025", 4) returns "2025".

VALUE()

Item	Description
What it does	Converts text that represents a number into a number.
Basic syntax	VALUE(<text>)
Where used in this project	Measure 5.
Example	VALUE("2025") returns 2025, so 1 can be subtracted.

FORMAT()

Item	Description
What it does	Converts a value to text using a format string.

Item	Description
Basic syntax	FORMAT(<value>, <format string>)
Where used in this project	Measure 5.
Example	FORMAT(2024, "0000") returns "2024", which is joined to “FY” to form “FY2024”.

IN operator

Item	Description
What it does	Tests whether a value equals any value in a list. It is a shorter form of several equality tests joined by OR.
Basic syntax	<column> IN { <value1>, <value2>, ... }
Where used in this project	Measure 6.
Example	'Sheet1'[Line_Item_as_reported] IN { "Current tax", "Deferred tax" } keeps both tax rows, so FY2023 gives 9,287 + (−73) = 9,214.

3.1 Filter context and the Fiscal_Year slicer

Filter context is the set of filters that decide which rows of Sheet1 a measure can see. It comes from slicers, from the categories on a chart axis, from page and visual filters, and from the filters written inside CALCULATE. A measure is evaluated again for every card value and every chart point, each with its own context.

The Fiscal_Year slicer adds a filter on Sheet1[Fiscal_Year]. CALCULATE keeps that filter unless an argument names the same column. The Statement and Line_Item filters inside the measures replace any outside filters on those columns, so slicers or visuals cannot change which line item a measure reads. Measure 5 deliberately removes the year filter with ALL to reach the previous year.

Context	Total Revenue	Net Profit Margin %	Revenue Growth %
No year selected	642,077	16.60%	Depends on how SELECTEDVALUE and VALUE handle several years (untested)
Slicer = FY2024	153,670	17.08%	4.70%
Slicer = FY2025	162,990	16.41%	6.06%
Slicer = FY2024 and FY2025	316,660	16.74% (26,248 + 26,750 = 52,998 ÷ 316,660)	SELECTEDVALUE returns blank, so behaviour is untested
Chart axis point FY2026	178,650	16.50%	9.61%

Check: 52,998 ÷ 316,660 = 0.16737, shown as 16.74%.

4. Measure Validation and Expected Outputs

4.1 Confirmed financial statement values

All amounts are in ₹ crore. FY2023 revenue, PBT and net profit also agree with the source rows seen in the workbook.

Financial year	Revenue from operations	PBT	Net profit	Dashboard labels
FY2023	146,767	33,322	24,108	146.8K / 33K / 24.1K
FY2024	153,670	35,988	26,248	153.7K / 36K / 26.2K
FY2025	162,990	37,608	26,750	163.0K / 38K / 26.8K
FY2026	178,650	39,995	29,474	178.7K / 40K / 29.5K
Total	642,077	146,913	106,580	Page 1 cards: ₹6,42,077 / ₹1,46,913 / ₹106.58K

Result. The four-year totals equal the Page 1 card values exactly, and every yearly label equals the confirmed value after rounding. Status: Matches dashboard output.

4.2 Recalculated outputs compared with the values supplied

Measure	Year	Supplied	Calculated	Dashboard	Status
Revenue Growth %	FY2024	4.71%	4.70%	4.70%	Needs correction
Revenue Growth %	FY2025	6.07%	6.06%	6.06%	Needs correction
Revenue Growth %	FY2026	9.61%	9.61%	9.61%	Matches dashboard output
Net Profit Margin %	FY2023	16.43%	16.43%	16.43	Matches dashboard output
Net Profit Margin %	FY2024	17.08%	17.08%	17.08	Matches dashboard output
Net Profit Margin %	FY2025	16.41%	16.41%	16.41	Matches dashboard output
Net Profit Margin %	FY2026	16.49%	16.50%	16.50	Needs correction
Effective Tax Rate %	FY2023	27.65%	27.65%	27.65%	Matches dashboard output
Effective Tax Rate %	FY2024	27.07%	27.06%	27.06%	Needs correction
Effective Tax Rate %	FY2025	28.87%	28.87%	28.87%	Matches dashboard output
Effective Tax Rate %	FY2026	26.31%	26.31%	26.31%	Matches dashboard output

Calculations (unrounded): revenue growth 0.047033, 0.060649, 0.096080; net profit margin 0.164261, 0.170808, 0.164117, 0.164982; effective tax rate 0.276515, 0.270646, 0.288716, 0.263058. The differences of 0.01 percentage points in four cells come from rounding: 6.0649% rounds down to 6.06%, 27.0646% to 27.06%, 4.7033% to 4.70%, and 16.4982% rounds up to 16.50%.

4.3 Other measures

Measure	FY2023	FY2024	FY2025	FY2026	Status
Current Ratio	1.81	2.31	2.27	1.98	Matches dashboard output; Requires source-level reconciliation
Working Capital (₹ crore)	31,700	50,600	54,200	51,200	Approximate – dashboard label only
Operating Cash Flow (₹ crore)	22,467	≈ 25,000	≈ 36,000	≈ 34,000	FY2023 Verified against source data; others Approximate – dashboard label only
Free Cash Flow (₹ crore)	19,888	≈ 23,000	≈ 33,500	≈ 34,000	FY2023 Verified against source data; FY2026 Needs correction
Investing Cash Flow (₹ crore)	≈ −1,000	Not visible	Not visible	Not visible	Requires source-level reconciliation
Financing Cash Flow (₹ crore)	≈ −27,000	≈ −18,000	≈ −24,000	≈ −40,000	Approximate – dashboard label only
Total Equity (₹ crore)	Not supplied	Not supplied	Not supplied	Not supplied	Requires source-level reconciliation

4.4 Status register for all 13 measures

No.	Measure	Formula status	Output status
1	Total Revenue	Requires formula screenshot	Matches dashboard output; FY2023 Verified against source data
2	Total Net Profit	Requires formula screenshot	Matches dashboard output; FY2023 Verified against source data
3	Total PBT	Requires formula screenshot	Matches dashboard output; FY2023 Verified against source data
4	Net Profit Margin %	Requires formula screenshot. Display format to be checked (D1)	Matches dashboard output; FY2026 supplied value Needs correction
5	Revenue Growth %	Requires formula screenshot	Dashboard and calculation agree; supplied FY2024 and FY2025 values Needs correction
6	Effective Tax Rate %	Requires formula screenshot	Matches dashboard output; FY2024 supplied value Needs correction
7	Total Equity	Requires formula screenshot	Requires source-level reconciliation
8	Current Ratio	Requires formula screenshot	Matches dashboard output; Requires source-level reconciliation
9	Working Capital	Requires formula screenshot	Approximate – dashboard label only

No.	Measure	Formula status	Output status
10	Operating Cash Flow	Requires formula screenshot	FY2023 Verified against source data; others Approximate – dashboard label only
11	Investing Cash Flow	Requires formula screenshot	Requires source-level reconciliation
12	Financing Cash Flow	Requires formula screenshot	Approximate – dashboard label only; Requires source-level reconciliation
13	Free Cash Flow	Requires formula screenshot	FY2023 Verified against source data; FY2026 Needs correction

5. Important Calculation Considerations

5.1 Revenue calculation

Use Revenue from operations, not Total income. Total income includes Other income, net (2,701 in FY2023). Using it would inflate the revenue base and lower the margin (16.13% instead of 16.43% for FY2023).

5.2 Profit calculation

Net profit is the line Profit for the year, and PBT is the line Profit before tax, each filtered to the Income Statement. The Cash Flow statement also starts with a line called Profit for the year (Figure 4), so the Statement filter prevents the same profit from being counted twice.

5.3 Effective tax rate

The numerator must include both Current tax and Deferred tax. Current tax alone would give 27.87% for FY2023 (9,287 ÷ 33,322) instead of 27.65%. Deferred tax can be negative, so the sum can be lower than current tax.

5.4 Percentage formatting

Return ratios as decimals and apply the Percentage format in Power BI (with two decimals). Do not multiply by 100 in the formula and also apply the Percentage format, because the value would then show 100 times too high (for example 1,643.00%). On the dashboard, Net Profit Margin % is shown as 16.60 without a percent sign, while Revenue Growth % and Effective Tax Rate % show percent signs. This inconsistency needs checking (D1).

5.5 Cash flow

Preserve negative values. A negative cash flow is an outflow and must not be converted to a positive amount unless the calculation requires it. Negative investing or financing cash flow is not automatically a problem.

5.6 Free cash flow

CapEx is stored as a negative number, so Free Cash Flow = Operating Cash Flow + CapEx. Check the CapEx line exists for every year: a missing line makes the measure silently equal to operating cash flow (FY2026 shows this pattern).

5.7 Current ratio and working capital

Use the exact line items Total current assets and Total current liabilities. Do not use Total assets, Total liabilities or sub-items. A label typed differently from the source returns blank.

5.8 Expense breakdown

The donut on Page 4 is built from Value_Cr by Line_Item_as_reported and is not one of the 13 measures. Do not include Total expenses together with the individual expense lines, because Total expenses is itself a row in the Expenses section and would double the total. Also set the Statement filter to Income Statement. The Cash Flow statement repeats some labels (for example Finance cost, 284 in FY2023, Figure 4), and the legend shows two depreciation labels with identical totals, so cash flow rows appear to be included (Figure 5).

5.9 Filter context

The Fiscal_Year slicer and the chart axes change what each measure returns, as shown in Section 3.1. Statement and Line_Item filters inside each measure fix what is read, and Revenue Growth % removes the year filter on purpose.

6. Error Identification and Formula Review

Differences between the recorded formulas, the values supplied and the dashboard screenshots are listed here. Nothing has been replaced in Section 2: recorded formulas are shown as supplied.

6.1 Discrepancy register

ID	Item	Evidence	Status and action
D1	Net Profit Margin % displays without a percent sign	The card shows 16.60 and the Page 2 chart shows 16.43, 17.08, 16.41 and 16.50 (Figures 1 and 2), while Revenue Growth % and Effective Tax Rate % show percent signs. The recorded formula (no × 100) with Percentage format would show 16.60%.	Needs correction / Requires formula screenshot. Open the formula bar and the Format setting. If the live formula multiplies by 100, it differs from the recorded one.
D2	Revenue Growth % values supplied	Supplied 4.71% and 6.07%. Calculated and displayed: 4.70% and 6.06%.	Needs correction. Use 4.70% and 6.06%.
D3	Effective Tax Rate % FY2024	Supplied 27.07%. Calculated and displayed: 27.06%.	Needs correction. Use 27.06%.
D4	Net Profit Margin % FY2026	Supplied 16.49%. Calculated 16.4982%, displayed 16.50.	Needs correction. Use 16.50%.
D5	Free Cash Flow FY2026	Operating cash flow ≈ 34K and free cash flow 34.0K (Figure 3), implying CapEx near zero, unlike earlier years (about 2K to 2.6K). With the recorded formula, a missing or differently worded CapEx line returns blank and FCF equals OCF. Not confirmed.	Needs correction / Requires source-level reconciliation. Check the FY2026 CapEx line (see 6.2).

ID	Item	Evidence	Status and action
D6	Investing Cash Flow missing FY2024 to FY2026	Only an FY2023 bar (−1K) appears (Figure 3). The formula matches one exact label, so a differently worded label in later years would return blank. Not confirmed.	Requires source-level reconciliation. List the investing total labels for each year.
D7	Total Equity has no value or visual	No value was supplied and the Page 3 screenshot shows none.	Requires source-level reconciliation. Add the value or a screenshot.
D8	Expense donut total	Donut total 529.41K against about 509K of annual total expenses on Page 1. Two depreciation labels each show 18.62K. Cash Flow rows such as Finance cost appear in the data (Figure 4). The gap of about 20K is consistent with Cash Flow rows being included, mainly depreciation.	Requires source-level reconciliation. Apply Statement = Income Statement and exclude Total expenses (Section 5.8). On a corrected total of about 509K, the employee benefit share would be about 67% (342.0K ÷ 509K), not 64.6%. This is approximate.
D9	Total Revenue has no Statement filter	Measures 2, 3 and 6 filter to the Income Statement. Measure 1 does not. The output is correct today because the label is not repeated.	Improvement, not an error. See 6.2.
D10	Measures on the dashboard but not in the 13	Total_expenses (Page 1 chart) and Basic and Diluted EPS (Page 2) appear on the dashboard. Total assets and Total equity and liabilities are charted from Sum of Value_Cr by line item.	Not documented here. Supply the formulas if they should be included.
D11	Revenue Growth % with several years selected	SELECTEDVALUE returns blank when two or more years are in context. The result of VALUE on the resulting empty text has not been tested.	Test with two years selected. The chart in Figure 2 is not affected because each point has one year.
D12	Alternate result 0 in DIVIDE	Measures 4, 6 and 8 return 0 when the denominator is zero or blank, which would plot as 0 and not as a gap.	Minor. Consider leaving the alternate result blank.
D13	Exact text values not seen	The Statement value “Balance Sheet” and the labels “Total equity”, “Total current assets”, “Total current liabilities”, “Net cash used in investing/financing activities” do not appear in the supplied screenshots.	Requires source-level reconciliation. Check the spelling against RAW_ALL_DATA.

6.2 Suggested checks and refinements

These are suggestions. They do not replace the recorded formulas.

Check 1: is the CapEx line found for each year? Add a temporary diagnostic measure and place it in a table by Fiscal_Year. A result of 0 for FY2026 confirms the cause of D5.

```
CapEx Rows Found =
CALCULATE(
    COUNTROWS('Sheet1'),
```

```
    'Sheet1'[Statement] = "Cash Flow",
    'Sheet1'[Line_Item_as_reported] =
        "Expenditure on property, plant and equipment and intangibles"
)
```

COUNTROWS is not part of the recorded formulas. It counts the rows that match the same filters, so it returns blank or 0 where the label does not match.

Check 2: investing cash flow labels. Put Fiscal_Year and Line_Item_as_reported in a table, filter Statement to Cash Flow and filter the line item to text containing "investing". Compare the wording for each year with the formula text before changing anything (D6).

Refinement 1: Total Revenue with a Statement filter, for consistency with Measures 2 and 3 (D9). This is a proposed version and not the recorded one.

```
Total Revenue =
CALCULATE(
    SUM('Sheet1'[Value_Cr]),
    'Sheet1'[Statement] = "Income Statement",
    'Sheet1'[Line_Item_as_reported] = "Revenue from operations"
)
```

Refinement 2: Net Profit Margin % format. After reading the formula bar (D1), keep the formula as DIVIDE without × 100 and set the Format to Percentage with two decimals, so the card and chart show 16.60% and 16.50%.

6.3 Supporting screenshots

The figures below are from the project's dashboard and are the evidence for D1, D5, D6 and D8.

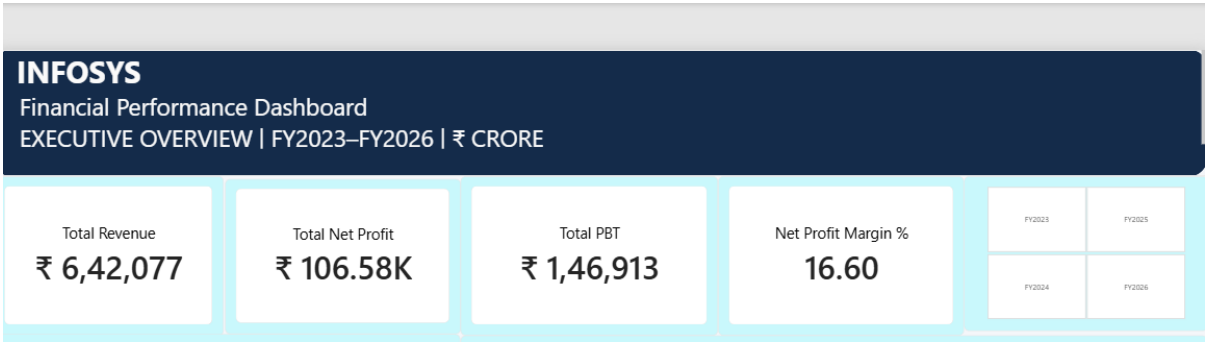

Figure 1: Page 1 KPI cards. Net Profit Margin % shows 16.60 with no percent sign.

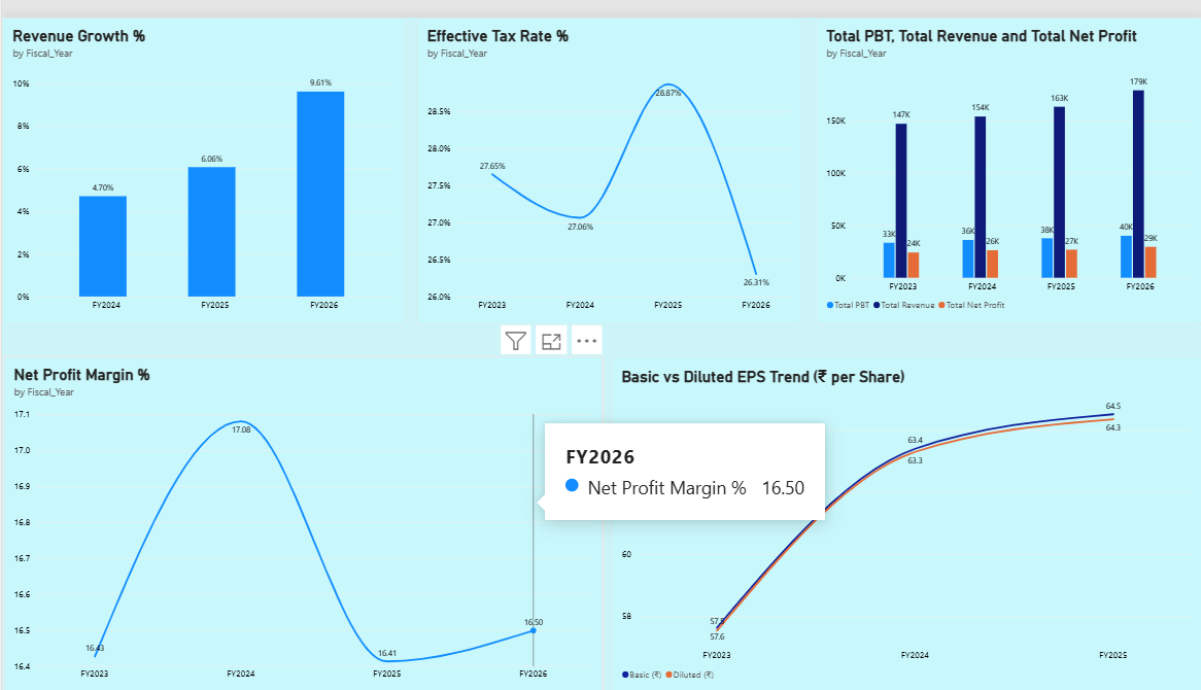

Figure 2: Page 2, Profitability Analysis (Revenue Growth %, Effective Tax Rate %, Net Profit Margin %, EPS).

Figure 3: Page 3, Financial Health & Cash Flow.

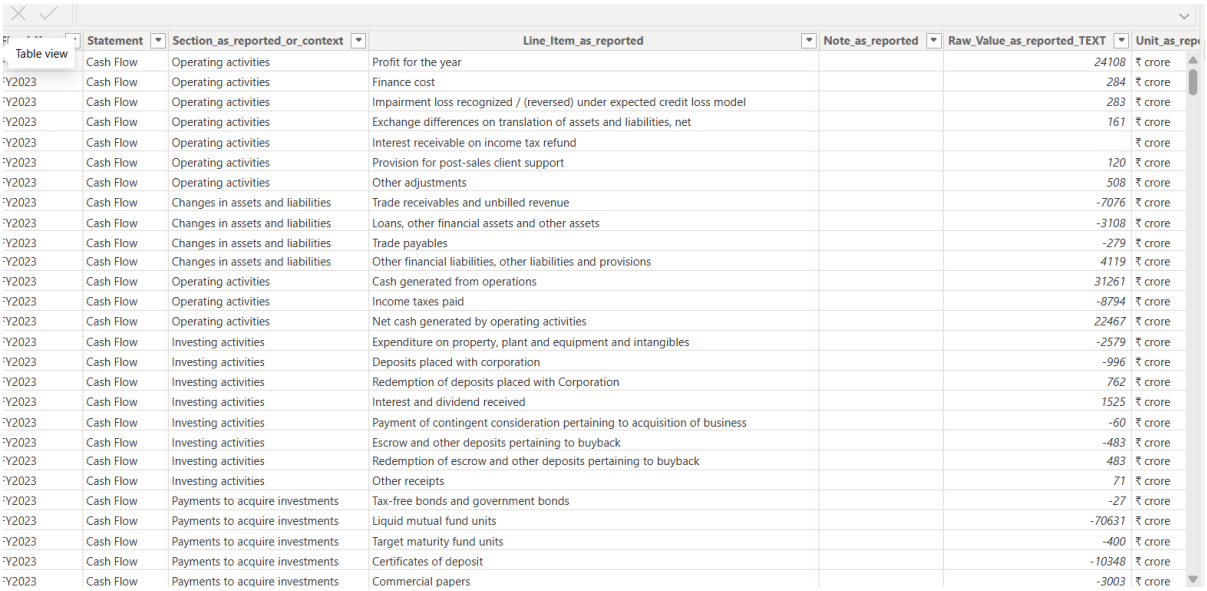

Table view

Statement	Section_as_reported_or_context	Line_Item_as_reported	Note_as_reported	Raw_Value_as_reported_TEXT	Unit_as_rep
Cash Flow	Operating activities	Profit for the year		24108	₹ crore
Cash Flow	Operating activities	Finance cost		284	₹ crore
Cash Flow	Operating activities	Impairment loss recognized / (reversed) under expected credit loss model		283	₹ crore
Cash Flow	Operating activities	Exchange differences on translation of assets and liabilities, net		161	₹ crore
Cash Flow	Operating activities	Interest receivable on income tax refund			₹ crore
Cash Flow	Operating activities	Provision for post-sales client support		120	₹ crore
Cash Flow	Operating activities	Other adjustments		508	₹ crore
Cash Flow	Changes in assets and liabilities	Trade receivables and unbilled revenue		-7076	₹ crore
Cash Flow	Changes in assets and liabilities	Loans, other financial assets and other assets		-3108	₹ crore
Cash Flow	Changes in assets and liabilities	Trade payables		-279	₹ crore
Cash Flow	Changes in assets and liabilities	Other financial liabilities, other liabilities and provisions		4119	₹ crore
Cash Flow	Operating activities	Cash generated from operations		31261	₹ crore
Cash Flow	Operating activities	Income taxes paid		-8794	₹ crore
Cash Flow	Operating activities	Net cash generated by operating activities		22467	₹ crore
Cash Flow	Investing activities	Expenditure on property, plant and equipment and intangibles		-2579	₹ crore
Cash Flow	Investing activities	Deposits placed with corporation		-996	₹ crore
Cash Flow	Investing activities	Redemption of deposits placed with Corporation		762	₹ crore
Cash Flow	Investing activities	Interest and dividend received		1525	₹ crore
Cash Flow	Investing activities	Payment of contingent consideration pertaining to acquisition of business		-60	₹ crore
Cash Flow	Investing activities	Escrow and other deposits pertaining to buyback		-483	₹ crore
Cash Flow	Investing activities	Redemption of escrow and other deposits pertaining to buyback		483	₹ crore
Cash Flow	Investing activities	Other receipts		71	₹ crore
Cash Flow	Payments to acquire investments	Tax-free bonds and government bonds		-27	₹ crore
Cash Flow	Payments to acquire investments	Liquid mutual fund units		-70631	₹ crore
Cash Flow	Payments to acquire investments	Target maturity fund units		-400	₹ crore
Cash Flow	Payments to acquire investments	Certificates of deposit		-10348	₹ crore
Cash Flow	Payments to acquire investments	Commercial papers		-3003	₹ crore
